I build the infrastructure that models train and run on: distributed compute, training pipelines and data platforms.

EXPERIENCE

Teamworks (formerly Zelus Analytics) Remote, Canada

Data Engineer II, tech lead of a 7-person data platform team **Aug 2025 - Present**

- Re-architected vendor data integration from a single-tenant application into a multi-tenant, event-driven lakehouse (SQS, Kafka, Hudi; Iceberg and DuckDB for query): about 30 TB, growing 170 GB a day.
- Built the lakehouse-to-application sync on commit-time watermarks: 100M+ row changes a day from a 13B-row source without rescans; traced sync failures to 96% no-change writes and removed the write amplification.
- Identified that the legacy applications could not support the company's AI initiatives; pitched the VP and CTO, unprompted, the system to build 200+ integrations cheaply and quickly.
- Built that system: a registry-driven data model (onboarding fell from about 6 months to about an hour, 8 live), a build system with reproducible images and graph-generated CI, and a custom coding-agent distribution that generates each remaining integration for about $90.
- Co-led the move of 38 production models from a daily batch to event-driven Kubernetes jobs (GCP Workflows, per-model Pub/Sub fan-out): results in under 1 hour instead of 24+. Converted 8 myself.
- Designed the platform's observability and ran its incidents: an S3 bulk delete recovered with zero data loss; a production 404 traced across five systems (Hudi, XTable, Iceberg, Glue, DuckDB) to an upstream bug.
- Found Kubernetes jobs sized and split wrongly on over-provisioned nodes in an architecture review; redesigned the layout and saved $60K in compute, confirmed independently by a staff engineer.
- Lead the team's architecture reviews, about a dozen so far, and sat on hiring panels for 2 senior hires.

Data Engineer I **Apr 2024 - Aug 2025**

- Designed and shipped, in my first month and ahead of the MLB trade deadline, the distributed system that runs a Monte Carlo roster model: a FastAPI service and three-stage Celery chain fan out Kubernetes indexed jobs, up to 4,000 parallel workers on 16-CPU pods. A manual process became a 45-minute run.
- Stood up an MLOps stack from scratch inside a client's own cloud as one of 2 engineers with production access: Kubernetes clusters, Terraform, Airflow workflows, model versioning APIs and model serving.
- Ran the operations side of 60+ production models owned by data scientists (PyTorch and custom): Airflow orchestration, Kubernetes indexed jobs, training and retraining pipelines, on call.

Earlier (2018 - 2023): Data Analyst, KOHO Financial; Senior Allocations Analyst, Loblaws; Data Developer, Luniko.

OPEN SOURCE AND PROJECTS

Built with a fleet of coding agents that I direct; the design, review and verification are mine.

- training-harness (PyTorch, Slurm; in progress), 2026: trains a 124M-parameter GPT on postings from my job board to score listing quality in its pipeline; hand-written loop, data-parallel on 8 L4 spot GPUs; Ray and JAX next.
- dibs (Go), 2026: a job admission and lease scheduler for machines many agents share: FIFO admission against CPU and memory budgets, no backfill so large jobs cannot starve; 3 TLA+ specs model-checked in CI.
- firstmate and no-mistakes (8.8K and 9.2K GitHub stars): an orchestrator for crews of coding agents and a gate that reviews and tests their changes; 11 merged pull requests, including liveness detection for stalled workers.

SKILLS

Platform: Kubernetes (GKE, EKS, K3s), Airflow, Celery, Kafka, SQS, Pub/Sub, Terraform, Argo CD, Pants, GitLab CI

Languages: Python (FastAPI, async SQLAlchemy), Go, SQL, TypeScript

Data: Hudi, Iceberg, Databricks (Spark SQL), DuckDB, BigQuery, Postgres

EDUCATION

BA, International Relations, University of Calgary, Canada **2018**
